

ED Home Medication Documentation

External Home Medication History

Medication history from some outside pharmacies can be pulled into MEDITECH and used to document home medication information.

Process:

1. Click **Reconcile Meds** on the tracker.
2. Click the **Ext Med Hx** button to import external medication history for this patient.

3. If the patient has an external med history, a list of medications appears.

If the patient has no information in the database, the message **"No External Medical History Retrieved"** appears.

4. In the **Add to Profile** column, select the check box next to each med that you want to pull in to the chart as a reported medication.
 - A lowlit med means that the med already appears as a Home Med and no action is needed here.
5. Enter the last dose, the last taken date, route, and frequency for each med selected.
6. Click **Save**. The external meds now appear under the Home Meds category.
