Documentation

Hemodynamic Monitor Data

1. Select the **Vital Signs Hemodynamic** assessment from the Worklist.
    - This intervention may need to be added
2. Click the **Document Spreadsheet** footer button.
3. Click the **Get Monitor Data** footer button.
4. Determine the amount of data pulled into the chart by **setting the beginning and end of a period of time**. The end time field contains the current time.
5. Set the **frequency**. Click **OK.**

Critical Points of Hemodynamic Monitoring	
Entering Account Numbers	Enter the account number by hand. • Do not scan the patient's armband. • You must do this BEFORE pulling the data into the monitor. • You must enter leading zeros in the account #.
Maximum Column Limit	The spreadsheet is limited to 18 columns of data. If there is more than that, you receive an error message that says "Maximum New Column Data reached, file and reload to add more columns." In this case, shorten the time frame for the data being pulled in.
Blank Cells in Data	When data is pulled in, some cells may be blank, due to issues with the monitor download. Manually enter the data in the blank cells that appear.
Cannot Find Patient	If you receive the error message "Cannot find patient," close the error message, and click the Get Monitor Data button again.
Discharge From Monitor	If the patient is being transferred or discharged, it is the responsibility of the bedside nurse to discharge the patient from the monitor. Please remember to download your data as this information will be purged.
Patient Already Admitted to Monitor	A patient must be discharged from one monitor before being added to a new monitor. If the patient is already admitted at a different location, you will see three dots appear (…) on the screen. Please contact that unit to remind them to discharge the patient from the monitor.
